

## CER46 - DATABASE MANAGEMENT SYSTEM

KASHYAP SHAH

$$(m)b + i = b$$

4 CER  $\Rightarrow$  B-BATCH

$$(n)k + i = b$$

COMPUTER ENGINEERING

9408718809

$$m \times n \times k \times l = p \times q \times r \times s$$

ANSWERS

$$q = 17$$

$$p = 13 \quad m = 13 \times 1 = 13$$

$$r = 5$$

$$s = 7$$

RSA algorithm : It is used to implement  
 assignments in cryptography.

$$n = p \times q$$

$$= 17 \times 13$$

$$= 221$$

$$\phi(n) = (p-1)(q-1)$$

$$= 16 \times 12$$

$$= 192$$

public key  $(e) = 5$

$$de = 1 + k\phi(n)$$

$$d = \frac{1+k\phi(n)}{e}$$

Let  $k=0$ ,  $d = \frac{1+0}{5} = \frac{1}{5}$  → not proper

$$k=1, d = \frac{1+193}{5} = \frac{193}{5} = 38.6 \text{ (not proper)}$$

$$k=2, d = \frac{1+2(192)}{5} = \frac{1+384}{5} = \frac{385}{5} = 77$$

∴ plain text = 7

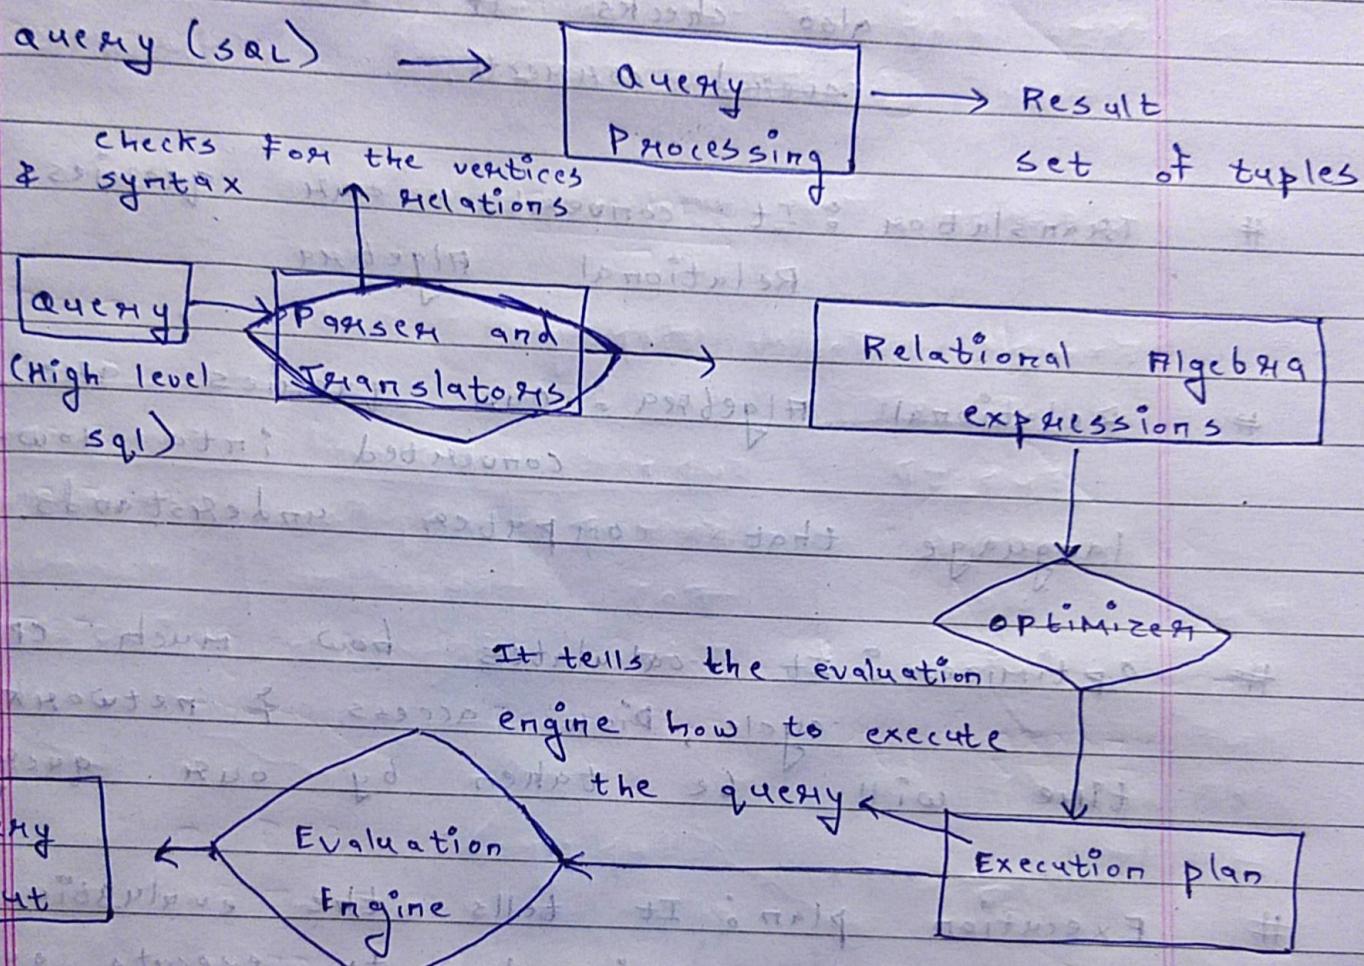

$$\begin{aligned} \text{For cipher Text} &= E(n) \text{ cipher} = m^e \pmod{n} \\ &= 7^5 \pmod{221} \\ &= 16807 \pmod{221} \\ &= 11 \end{aligned}$$

$$D(c)_{pt} = c^d \pmod{n}$$

$$= 11^{77} \pmod{221}$$

Decryption = 7

d9 Query Processing : Range of activities involved in extracting data from a database to process the query and generate result.

- # **query**: Commands that a user writes  
(select \* from the table name)
- # **Parsers**: It checks syntax of query and also checks if the relation is connected correctly.
- # **Translator**: It converts our queries into Relational Algebra.
- # **Relational Algebra**: Our queries are converted into low-level language that computer understands.
- # **Optimizer**: It calculates how much CPU cycle, Disk access & network time will be taken by our query.
- # **Execution plan**: It tells the evaluation engine, how to execute query.
- # **Evaluation Engine**: It evaluates our query and displays the output.

Q7 i) For all  $v$  ( $\text{is\_unk}(v.\text{gender}) \wedge \text{is\_unk}(v.\text{surname}) \wedge \text{is\_unk}(v.\text{firstname}) \wedge \text{is\_unk}(v.\text{occupation}) \wedge \text{is\_unk}(v.\text{birthdate}) \wedge \text{is\_unk}(v.\text{city}) \wedge \text{is\_unk}(v.\text{cast})$ )

$\Rightarrow$  For all  $\rightarrow \text{True}(T)$

$$\begin{aligned} T \wedge & ((F \wedge F \wedge F \wedge F \wedge F \wedge F) \wedge \\ & (F \wedge F \wedge F \wedge T \wedge F \wedge F \wedge F) \wedge \\ & (F \wedge F \wedge F \wedge F \wedge F \wedge F \wedge F) \wedge \\ & (F \wedge F \wedge F \wedge T \wedge F \wedge F \wedge F)) \end{aligned}$$

$$= T \wedge (F \wedge F \wedge F \wedge F)$$

$$= T \wedge F$$

$$= \underline{\underline{T}}$$

2) Exists  $v$  ( $v.\text{gender} = 'F'$   $\wedge$   $v.\text{birthdate}$

(approx.)

'1/6/1990'

$$\Rightarrow F \vee ((F \wedge T) \vee (T \wedge F) \vee (T \wedge T) \vee (T \wedge T))$$

$$= F \vee (F \wedge F \wedge T \wedge T)$$

$$= F \wedge T$$

$$= \underline{\underline{T}}$$

Q8 Projection Operator: ( $\pi$ ) is a unary operator in relational algebra that performs a projection operation.

⇒ It displays the column of a relational table based on specified attributes.

Notation:  $\pi_{\text{name}}(\text{table name})$

Example Table Employee

EMP_ID	EMP_name	EMP_email	EMP_phone
101	Kashyap	k@gmail.com	9408712809
102	Raj	R@gmail.com	9406918100
103	John	j@gmail.com	9426817890

#  $\pi_{\text{EMP-ID}, \text{EMP-name}}(\text{Employee})$

( $\text{EMP-ID}$ ,  $\text{EMP-name}$ ) output: ( $\text{EMP-ID}$ ) v ( $\text{EMP-name}$ )

EMP_ID	EMP_name
101	Kashyap
102	Raj
103	John

## # Tuple Relational Calculus      Domain Relational

1) In TRS, the variables represent the tables from specified relation.

1) In DRS, the variables represent the value drawn from specified column.

2) In this filtering variables uses type of relation.

2) In this filtering is done based on the domain of attributes.

3) A tuple is a single element in database term, it is a row.

3) A domain is equivalent to column data type & any constraints on value of data.

4) Example:

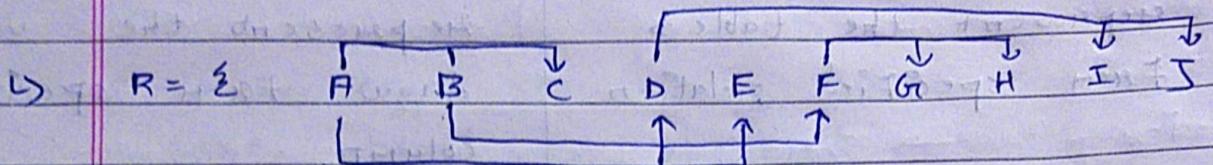

$\{ T | \text{employee}(t) \text{ and } t.\text{Dept\_ID} = 10 \}$

Example:

$\{ I | \langle \text{EMPLOYEE} \rangle \text{ DEPT\_ID} = 10 \}$

Q 5  $R = \{ A, B, C, D, E, F, G, H, I, J \}$

$$F = \{ AB \rightarrow C, A \rightarrow DE, B \rightarrow F, F \rightarrow GH, D \rightarrow IJ \}$$

Here A, B are the essential attributes

$$\text{closure of } (AB)^+ = ABCDEFGHIJ$$

so AB is the candidate key

$$AB \rightarrow C, A \rightarrow DE, B \rightarrow F, F \rightarrow GH, D \rightarrow IJ$$

BCNF ✓

3NF ✓ X X X X

2NF ✓ X X X X

1NF ✓ ✓ ✓ ✓ ✓

Here, the relation is in 1NF.

There is a partial dependency  $A \rightarrow DE$

Transitive dependency

$B \rightarrow F$

$F \rightarrow GH$

and also of all the dependency does not have  $\lambda$  as a super key

- Decomposition:

$R_1 (A \overline{B} C)$

$R_2 (A \overline{D E I J})$

$\hookrightarrow R_{21} (D \overline{I J})$   
 $R_{22} (\underline{\underline{A D E}})$

$R_3 (BFGH)$

$\hookrightarrow R_{31} (B \overline{F})$   
 $R_{32} (F \overline{G H})$

Then for the above tables are in BCNF,  
 There are 5 tables  $\Rightarrow R_1, R_{21}, R_{22}, R_{31}$  &  $R_{32}$
